The purpose of this modification is to remove unnecessary references to the Waste Isolation Pilot Project (WIPP). The contract is modified as follows:

Section C - C.2 IDAHO NUCLEAR TECHNOLOGY AND ENGINEERING CENTER (INTEC) is modified as follows:

The Idaho Nuclear Technology and Engineering Center (INTEC) (formerly the Idaho Chemical Processing Plant [ICPP]) is situated on 210 acres within a perimeter fence and approximately 55 acres located outside the fence. INTEC was built in the 1950s to reprocess SNF to recover uranium and krypton gas. INTEC consists of 290 facilities (approximately 1.2 million square feet) and two active CERCLA OUs.

The end state for INTEC under this contract is the following:

- Demolish or disposition all excess facilities
- Design, construct, and operate a treatment facility for liquid SBW *
- Provide interim storage of steam reformed product generated during the term of the contract
- Empty and disposition all Tank Farm Facility waste tanks*
- Place all EM SNF in safe dry storage
- Deactivate EM SNF wet storage basins (CPP-603)
- Dispose or disposition all excess nuclear material
- Complete all VCO tank system actions
- Complete all required OU 3-13 remediation, including CERCLA Tank Farm Interim Action
- Maintain and operate the ICDF
 - * In light of the legal uncertainty, all work under paragraph C.2.4.3 and the stabilization and disposal of residual solids and the in-place closure of the tank farm per Section C.2.8.1 shall require specific authorization by DOE.

After contract completion the following cleanup work will remain:

- Continued interim storage of treated SBW, and shipment to a repository upon identification and regulatory acceptance
- Cleaning and disposition Tank Farm Facility waste tanks and associated vaults and ancillary equipment
- Retrieval, packaging and off-site shipment of 4,440m³ of existing high level waste (HLW) calcine

. . (41)

- Completion of OU 3-14 remediation and documentation
- Demolition of remaining INTEC buildings and structures

. Mowel

- Continued operation and closure of ICDF
- Packaging and transport of SNF to repository

2. Section C - C.2.4.3 Sodium Bearing Waste* is modified as follows:

There are approximately 1,000,000 gallons of SBW in underground stainless steel tanks as described in Exhibit C.6 and summarized in Table C.1 below. A complete description of the SBW characteristics can be found in "Feed Composition for the Sodium Bearing Waste Treatment Process", INEEL/EXT-2000-01378, Revision 3 (September, 2003). Engineering Design files and reports for SBW treatment are available at www.id.doe.gov/doeid/rfpsharedlibrary/refdoc.htm.

The contractor shall conduct all necessary activities and provide all associated deliverables to enable DOE to issue a ROD for the *Idaho High-Level Waste & Facilities Disposition Final Environmental Impact Statement, September 2002* (HLW EIS) on SBW Treatment that would allow implementation of the preferred alternative of treating the SBW.

The contractor shall design and construct its SBW treatment and packaging facility to enable the conversion to treat the waste for alternate waste disposal at an alternate geologic repository for SNF/HLW, if needed. Additional pilot plant testing shall be performed to evaluate waste form performance relative to the high-level waste acceptance criteria of the geologic repository for SNF/HLW. The SBW facility will also be constructed so it could be converted for calcine treatment if needed. This includes improvements in process cell structural and seismic protection to meeting safety significant, performance category 3 (PC-3) design criteria, as required. The Total Project Cost for the project is \$570.9M.

The contractor shall obtain approval to commence operations (CD-4) no later than July 31, 2011. The treatment and packaging of liquid SBW will be completed by September 30, 2012 to enable the DOE to meet its regulatory commitments to remove all liquid waste from the underground tanks and treat the SBW by December 31, 2012. To address the current uncertainties in obtaining regulatory approvals for final disposal of the treated waste, the facility shall be designed and constructed to allow interim storage of all treated material by September 30, 2012, with the necessary equipment and commodities (i.e., product vessels and storage modules) to allow continued interim storage during the follow-on contract transition period. The contractor shall design and construct its SBW packaging facility with the capability for future packaging and shipping of the existing HLW calcine to the geologic repository for SNF/HLW per Section C.2.8.2. Additionally, in light of the legal uncertainty about classification of this waste, the contractor shall provide an alternative technical approach to prepare this waste for disposal as HLW in the geologic repository for spent fuel/HLW, which DOE may implement instead if it concludes that it is prevented from classifying this waste as other than HLW.

During SBW treatment operations, the contractor shall avoid or minimize generation of secondary wastes and/or ensure that any secondary waste has a disposition path and is disposed of, considering overall risk reduction. Residual solids are those that remain in the tanks after tank cleaning, and meet the RCRA closure plans and performance assessments for final tank farm closure. The contractor shall stabilize the residual solids as part of the final tank farm closure process described in Section C.2.8.1.

No new liquid waste will be added to tanks WM 187 through 190, except flushing liquid and grout during the cleaning and closure process.

• In light of the legal uncertainty, all work under paragraph C.2.4.3 and the stabilization and disposal of residual solids and the in-place closure of the tank farm per Section C.2.8.1 shall require specific authorization by DOE.
